The DNA was constructed from sequences encoding delta PLP4 (T41891) and MBP21.5 (T41889). The gene fusion can be used to express PM4 in bacterial hosts. PLP polypeptides (see also W00400, W06101-03 and W06105) can be used in the clinical assessment, diagnosis and treatment of MS. 359 C; 299 G; 228 T; Sequence 1125 BP;

Monoclonal antibody against the proteins distributed in the brain - is prepd. by using rat brain extract as immunogen belonging to IgG class which combines to rat brain extract antigen Claim 2; Page 2-3; 16pp; Japanese.
The sequence coding for RB35 was isolated from a CDNA library prepared from total adult female Sprague-Dawley rat brain mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        18-APR-1994 (first entry)
Encodes RB35 protein from rat brain.
RB35 antigen; immunogen; myelin; Sprague-Dawley; rat; brain;

Example 1; Pages 118-119; 142pp; English.

The present sequence encodes a novel soluble fused major histocompatibility complex (MHC) heterodimer:peptide complex comprising 1st and 2nd MHC domains, linked by a 5.25 residue linker, and an antigenic peptide able to associate with a peptide binding groove of the MHC molecule, linked in frame to the 2nd
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        11-SEP-1997 (first entry)

CDNA encoding soluble fused MHC heterodimer:peptide complex pLJ13.

Merical Description of auto: immune diseases, particularly used for the treatment of auto: immune diseases, particularly used for the treatment of auto: immune diseases, particularly multiple sclerosis

multiple sclerosis

Claim 7: Page 22: 54pp; English.

Se chimeric proteins have been developed comprising a Pseudomonas acruginosa exotoxin (PE) moiety linked to a myelin basic protein (MBP)

moiety selected from: (a) MBP; (b) amino acids 69:88 of guinea-ply MBP or an antigenic portion; (c) amino acids 69:88 of guinea-ply MBP or an antigenic portion; (d) amino acids 143:168 of human MBP or an antigenic portion; (d) amino acids 143:168 of human MBP or an antigenic portion; (d) amino acids sequence in which one or more amino acids sequences of (a), (b), (c), or (d), the modified sequences retaining at least 75% homology with the amino acid sequences. The present sequence represents an oligonuclectide used for constructing human BPP-PE chimeric proteins. The chimeric proteins can be used for the treatment of autoimmune diseases such as multiple sclerosis. The chimeric proteins of action the paying no acide of the construction for the treatment of autoimmune diseases such as multiple sclerosis. The chimeric proteins of action the paying no acide of the construction for the paying no acide of the construction for the
domain by a 5-25 residue linker. The complex can be used to induce immunological tolerance in adults susceptible to, or suffering from an autoantigen related disease, e.g. insulin dependent diabetes mellitus (IDDM), by antagonising the binding of particular T cells and antigen presenting cells, to induce anergy (immunological non-responsiveness) in the targeted T cell. As the heterodimers and corresponding antigen are permanently linked into a single chain, obstating the requirement for complex heterodimer truncation of formation, the complex eliminates inefficient and non-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 19-FEB-1998 (first entry)
Human BPP-PE chimeric protein construction oligonucleotide Oligo 3.
Pseudomonas exotoxin; myelin basic protein; chimeric protein; autoimmune disease; multiple sclerosis; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           29-MAY-1997.

Claim 7; Page 9; Supp; English.

New chimeric proteins have been developed comprising a Pseudomonas aerotoxin (PE) modety linked to a myelin basic protein (MBP)

moiety selected from: (B) MBP; (D) amino acids 69-88 of guinea-pig MBP or an antigenic portion; (G) amino acids 84-102 of human MBP or an antigenic portion; (A) amino acids 143-168 of human MBP or an antigenic portion; (A) amino acids sequence in which one or more amino acids have been deleted, added, substituted or mutated in the amino acid sequences of (a), (b), (c), or (d), the modified sequences retaining at least 75% homology with the amino acid sequences. The present sequence represents an oligonuclectide used in the synthesis of BPP-PE chimeric proteins can be used for the treatment of autoimmune diseases such as multiple sclerosis. The chimeric proteins can specifically target and kill MBP specific T cells while having no effect on non-target cells.

A;Introns: 59/3; 85/3; 120/3; 132/3; 143/3; 183/3
C;Function:
A;Description: probably helps maintain myelin structure
C;Superfamily: myelin basic protein
C;Keywords: acetylated amino end; alternative splicing; citrulline; experimental auto
C;CKeywords: acetylated amino end; alternative splice form #status predicted <MATI>
F;2-197/Product: myelin basic protein, 21.5K splice form #status predicted <MF;2-59,86-197/Product: myelin basic protein, 18.5K splice form #status experimental <F;2-59,86-197/Product: myelin basic protein, 18.5K splice form #status experimental <F;2-59,86-132,144-197/Product: myelin basic protein, 17.2K splice form #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,149,157,180,197/Modified site: citrulline (Arg) (in form C-8) #status experimental F;26,32,449,457/Mo
                      myelin basic protein S - rat
N;Alternate names: small myelin basic protein
C;Species: Rattus norvegicus (Norway rat)
C;Date: 24-Apr-1984 #sequence_revision 08-Feb-1996 #text_change
C;Accession: B24351; A90275; A94243; A21062; A03142
R;Schalch, M.; Budzinski, R.M.; Stoffel, W.
Biol. Chem. Hoppe-Seyler 367, 825-834, 1986
A;Title: Cloned proteolipid protein and myelin basic protein cDN
A;Reference number: A24351; MUID:87026249
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A; Molecule type: protein
A; Molecule type: protein
A; Residues: 1-171 <WES>
C; Comment: This protein may function in maintaining the proper structure of myelin.
C; Comment: This protein may function in maintaining the proper structure of myelin.
C; Superfamily: myelin basic protein
C; Keywords: blocked amino end; methylated amino acid; myelin; structural protein
F; 1, Modified site: blocked amino end (Ala) (probably acetylated) #status experimental
F; 107/Modified site: omega-N-methylarginine or omega-N, omega-N'-dimethylarginine (Arg
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ş

C;Function:
A;Description: probably helps maintain myelin structure
C;Superfamily: myelin basic protein
C;Superfamily: myelin basic protein
C;Reywords: alternative splicing; myelin; structural protein
C;Reywords: alternative splicing; myelin; structural protein
C;Reywords: alternative splicing; myelin; structural protein
F;1-190, 217-276, 316-328/Product: Goll: mbp protein (clone J37) #status predicted <MAT>
F;134-328/Product: myelin basic protein, splice form 17K-a #status predicted <MAT
F;134-190, 217-328/Product: myelin basic protein, splice form 18.5K #status predicted <MAT
F;134-190, 217-263, 275-328/Product: myelin basic protein, splice form 17K-b #status predict
F;134-190, 217-274, 316-328/Product: myelin basic protein, splice form 14K #status predict
F;134-190, 217-274, 316-328/Product: myelin basic protein, splice form 14K #status predict
myelin basic protein - bovine
M;Alternate names: myelin Al protein
N;Contains: myelin peptide amide-12 (MPA-12); myelin peptide amide-16 (MPA-16)
C;Species: Bos primigenius taurus (cattle)
C;Species: Bos primigenius taurus (cattle)
C;Date: 18-Dec-1981 #sequence_revision 18-Dec-1981 #text_change 07-May-1999
C;Accession: A92089; A92160; A92087; S54343; A61641; B61641; A03140

A; Molecule type: protein
A; Molecule type: protein
A; Residues: 1-14 <TAK>
A; Residues: 1-14 <TAK>
A; Note: the sequence in the abstract is inconsistent with that in figure 3 in having Gl
A; Note: this peptide has a carboxyl-terminal amide probably produced by a non-enzymatic
C; Superfamily: myelin basic protein
C; Keywords: acetylated amino end; amidated carboxyl end; experimental autoimmune enceph
F; 1-171/Product: myelin basic protein #status experimental <AMI>
F; 1-14/Product: myelin peptide amide-14 #status experimental <PAI2>
F; 1-74/Product: myelin peptide amide-14 #status experimental
F; 14/Modified site: acetylated amino end (Ala) #status experimental
F; 14/Modified site: amidated carboxyl end (Tyr) (amide in mature form myelin peptide am
